

Tour Master Pro (Nylon)

Tour Master Pro (Nylon) is the professional-grade putting surface in the CTC lineup. The distinction between Tour Master and Tour Master Pro comes down to one material decision: Nylon vs. Poly.

Nylon or Poly?

Nylon is harder, denser, and more dimensionally stable than Poly under repeated ball and foot traffic. The blade memory is stronger — after a putt, a chip, or a practice session with consistent traffic patterns, Nylon recovers its upright position more reliably than Poly. That blade recovery is what keeps ball roll true over time on a high-use surface. For clients who want a practice green that plays like a practice green in year three, not just year one, the fiber choice matters.

Engineered for Tournament-Level Performance

Tour Master Pro is the right call for tournament-level residential installs, commercial putting facilities, and any application where the client is serious about performance consistency. It's a different category than Tour Master — not just an upgrade, a different material with different performance characteristics.

Spec	Detail
Pile Height	.63 inches (low-profile performance height)
Fiber Type	Tournament Grade Performance Nylon
Construction	Grain-neutral (true roll in every direction)
Warranty	15-year material
